

Shark Tank India Investment Analysis

Project Report

Introduction

This project focuses on exploring investment patterns from Shark Tank India using a dataset that contains details about brands, ideas, investment amounts, debt, equity, and individual investor participation. The goal of this analysis is to understand which startups received the highest funding, how investors behaved across different episodes, and to identify patterns in funding stages and deal distribution.

The analysis was carried out using Python for preprocessing and Power BI for visualization.

Abstract

The study highlights key investment trends from Shark Tank India by examining episode-wise funding, investor involvement, equity distribution, and top-performing brands. After cleaning and preparing the dataset, several insights were derived, such as which investors closed the most deals, which brands secured the highest amount of funding, and how debt varies across funding stages. The final dashboard presents a clear and interactive picture of the investment landscape.

Tools Used

- **Excel:** Basic review and formatting of the dataset
- **Python (Pandas):** Data cleaning, preprocessing, handling missing values
- **Power BI:** Data modelling, DAX calculations, dashboard creation

Steps Involved in Building the Project

Step 1: Importing and Understanding the Dataset

The original dataset contained columns such as Episode Number, Pitch Number, Brand, Idea, Investment Amount, Debt, Equity, and shark-specific participation columns (Aman, Anupam, Ashneer, Peyush, Namita, Vineeta, Ghazal).

Step 2: Data Cleaning

- Removed unnecessary spaces.
- Converted investment and debt values to numeric format
- Converted Equity to decimal format
- Ensured there were no duplicates
- Verified the Season column and filtered relevant records

Step 3: Creating the “Funding Stage” Column

The dataset did **not** originally include a Funding Stage field. So the new column was created manually based on investment patterns:

- **Early Stage**
- **Seed Stage**
- **Growth Stage**
- **No Deal**

This new column was added to support better grouping and comparison.

Step 4: Importing Cleaned Data into Power BI

After preprocessing, the cleaned CSV was loaded into Power BI. The model was organized for easier DAX calculations.

Step 5: Creating DAX Measures

Some measures that were created are:

- **Total Investment**
- **Total Deals**
- **Total Debt Given**
- **Average Equity %**

Investor participation columns (Y/N) were converted into numerical form to calculate the number of deals per investor.

Step 6: Building the Dashboard

The dashboard visuals includes:

- **Top 10 Brands by Investment (Bar Chart)**
- **Number of Deals per Investor (Donut Chart)**
- **Top 10 Ideas by Investment (Table)**
- **Total Debt by Funding Stage (Funnel)**
- **Investment by Episode (Line Chart)**
- **Overall KPIs for Investment, Deals, Debt, Avg Equity (Cards)**
- **Funding stage and Episodes filtering for better analysis (Slicers)**
- **Insights Panel with key observations.**

5. Conclusion

The analysis provided a clear view of how investments are distributed in Shark Tank India. Some brands such as *Kabaddi Adda* and *RoadBounce* attracted the highest funding. Episode 16 recorded the highest investment amount. Among all investors, **Aman closed the most deals**, showing strong participation across multiple pitches. Debt was primarily seen in the Early Funding Stage, while Growth-stage startups attracted moderate funding.

The project demonstrates how real-world business decisions can be understood using data analytics and highlights the importance of visualization tools like Power BI in summarizing complex information in an easy-to-understand format.
